Linux users, and many of you are likely Windows users, have spent ages managing virtual machines.

VirtualBox is a very capable virtualization platform but configuring it is not obvious and as a result a lot of users gave up entirely. Vagrant on the other hand, is a collection of tools that allows you to quickly spin up a new virtual machine while using the most popular virtualization platform. The Vagrant site provides installation instructions. These are somewhat confusing and in general I highly recommend reading the Getting Started section of the site. Here are some of the main features of Vagrant: Provides a very simple way to spin up a virtual machine. Vagrant removes the need to have VirtualBox installed on your system. Vagrant is a collection of simple files which means it can be run on almost any machine. Vagrant can act as both a provisioner and provisioner plug-in. Providers can be chosen at will from a set of plug-ins (including the ubiquitous Puppet and Chef). Your local Vagrant directory contains a directory for each virtual machine you create which means you can keep all your machines in one place. The Vagrant platform's virtualization model is the same as VirtualBox, so all the host controls available in VirtualBox are available within Vagrant. Vagrant allows you to configure the settings for each virtual machine. To check out Vagrant please visit vagrantup.com. The download is free. This is an end user license (EULA) agreement.
