3D drawing AutoCAD supports 3D drawing and can import and export 3D objects. It has the ability to export (DWG) files to 3D using the integrated 3D Modeler. Exports are saved as 2D drawings with many of the standard properties of a 2D drawing. These drawings are updated in the same manner as 2D drawings and can be compared to existing drawings for change tracking. The 2007 release of AutoCAD introduced 'Transaction Management' which allows users to maintain revisions of a drawing (tracked by version numbers) by locking/unlocking parts of a drawing and allowing changes to the drawing (e.g. adding, deleting or moving parts). AutoCAD allows users to manipulate an individual part of a drawing by simply dragging it in any direction and the software updates the drawing to reflect the position. This can be done on-the-fly and requires no user input. AutoCAD's 3D Modeling tools allow users to import and export 3D objects. AutoCAD supports 1-manitou poroject formats (.por,.dwg,.stp), as well as various 3D file formats (.obj,.stl,.3dm,.zip,.fbx). 3D objects can be shared by standard means (e.g. FTP) and may be annotated (e.g. save and email) in the same manner as 2D drawings. Q: Mutable array in Objective-C++ I am reading Apple's doc on Objective-C++ here: It says to use NSMutableArray if you are using arrays that need to be modified. My question is: How can you declare NSMutableArray in a.mm file? If I try to do something like: NSMutableArray*> *orderedStrings; I get an error saying "NSMutableArray is not a member of NSMutableArray". A: My question is: How can you declare NSMutableArray in a.mm file? The NSMutableArray is a class and you can only create objects of classes. You can't create an instance of an object of type NSMutableArray. All classes have a class pointer that you must send alloc messages to. When the alloc message is executed, it will return a pointer to a new object. So you can send alloc to an NSMutableArray, and you will get a new NSMutableArray. You can also send init messages to create instances of an object. The object will be returned, and you can then add your own values to that array. If you want to keep a "template" array of mutable arrays, you can use an NSArray and add your mutable arrays to it. Then you can keep a reference to the NSArray in your header file.
